

Florida Department of Law Enforcement Assessment of Unsubmitted Sexual Assault Kits Executive Summary

The 2015 Legislature allocated the Florida Department of Law Enforcement (FDLE) \$300,000 to conduct a statewide assessment of sexual assault kits (SAKs) that have not been submitted for analysis. It also required the department to submit a report of its findings, including reasons for delays or deferment of analysis, to the Governor, President of the Senate and Speaker of the House of Representatives by January 1, 2016. This document provides the findings requested, information on DNA casework, and a business plan proposal for the testing of unsubmitted SAKs from reporting victims. This summary is a snapshot of significant findings included in the full report:

- Response rate to the survey was exceptional and included 279 local law enforcement agencies representing 89 percent of Florida's population.
- Agencies that responded to the survey accounted for 91 percent of the rapes reported in 2014, according to FDLE's Uniform Crime Report statistics.
- Responding agencies indicated there were approximately 13,435 unsubmitted SAKs within their inventories and approximately 9,484 of them should be submitted.
- Of this overall total, 6,774 kits are housed in jurisdictions served by county forensic laboratories and 6,661 are housed in jurisdictions served by FDLE crime laboratories.
- Agencies identified several appropriate investigative and legal reasons for not submitting kits for testing.
- Biology/DNA casework by FDLE labs is increasing about five percent per year.
- In 2015, the department received approximately 13,400 incoming Biology/DNA cases statewide.
- SAKs received by FDLE labs have increased by nearly 141 percent in the past four years and most significantly in the past year (approximately 83 percent).
- Biology/DNA casework on sexual assault cases generally requires more man-hours than other types of cases.
- Proposals to test unsubmitted SAKs (defined as new backlog) are dependent upon additional funding for outsourcing, technology, overtime and a stabilized workforce of crime laboratory analysts.
- The most cost efficient and timely way to manage this backlog is through outsourcing a portion of SAKs, obtaining additional robotics through federal funding, and utilizing overtime funds to allow scientists to conduct technical review of these cases and upload them to the FBI's National Combined DNA Indexing System.
- Proposals for managing the backlog range from approximately \$9 to \$32 million (FDLE funding – not local laboratories) with timeframes ranging from three to nine years.
- Other states and municipalities that have engaged in or are in the process of testing of unsubmitted SAKs have similar cost/time estimates.
- FDLE recommends continuing to seek funding, like the New York County District Attorney grant, to offset the cost associated with working unsubmitted SAKs.
- FDLE recommends testing all SAKs from reporting victims in the interest of public safety.
- FDLE recommends reverting the \$300,000 appropriated for this assessment into overtime for Biology or contracted services to outsource SAKs.

Florida Department of Law Enforcement Assessment of Unsubmitted Sexual Assault Kits

A sexual assault kit (SAK) is a package that contains items collected from the body of a sexual assault victim. The items, including swabs from the body, are collected by a medical professional and documented on accompanying forms. The kit can be processed by a laboratory and the results used to aid law enforcement investigations and the courts in the pursuit of criminal prosecution.

Introduction

Increased awareness of the potential of DNA evidence to exonerate the falsely accused or to solve cases, even beyond the case for which the evidence was collected, has grown exponentially in recent years, not just among criminal justice professionals but also among the general public. Through laws requiring the submission of DNA samples from those arrested, charged or adjudicated for felonies, local, state and national DNA databases have grown significantly thereby enhancing the potential for matches or “hits” of offenders to other unsolved crimes.

DNA awareness and enhanced federal funding have highlighted the issue of unsubmitted SAKs throughout the nation. Unsubmitted SAKs contain evidence pertaining to an allegation of sexual assault that was collected and preserved but never submitted to a forensic laboratory. Additionally, national media outlets have begun reporting on the experiences of municipalities and states that initiated the process of inventorying and testing previously unsubmitted SAKs.

The urgency to test all SAKs is due to the development of the FBI’s National Combined DNA Indexing System (CODIS), which provides laboratories the ability to compare and search DNA case results submitted by a state or local DNA laboratory against national records. This has, in general, proven the public safety value for testing all kits.

For example, in the case of a sexual assault where a SAK is collected from the victim and submitted to FDLE, a DNA sample of the suspected perpetrator is developed from the swabs in the kit. The profile attributed to the perpetrator is entered into FDLE’s DNA Database and searched against convicted offender and arrestee profiles through CODIS. If there is a “hit”, the laboratory will go through procedures to confirm the match and, if confirmed, will obtain the identity of the suspected perpetrator. The DNA profile is also searched against the database of crime scene profiles in an attempt to link two or more crimes. The law enforcement agencies involved in these cases are then able to share the information obtained on each of the cases and possibly develop additional leads.

In 2000, the City of New York initiated the process of inventorying and testing all previously unsubmitted SAKs without regard to the status or facts of the case (forklift approach). Testing of 17,000 SAKs resulted in over 2,000 DNA matches and 200 cold case prosecutions across New York City. Those offenders are now serving more than 900 years in prison. Similar results have been reported in Michigan where the Wayne County Prosecutor’s Office identified 188 potential serial rapists and obtained 15 convictions. In Houston, Texas, testing of 6,663 untested SAKs resulted in 850 matches in the federal DNA database and the prosecution of 29

offenders.¹ In each of these cases, the testing took several years to accomplish and outsourcing was a major contributing factor in the ability of these entities to continue working their daily caseload while managing the testing and processing of backlogged untested SAKs.

Law enforcement agencies have an obligation to every crime victim – first and foremost to respond to reports of criminal activity and to handle the investigation and evidence collection and submission in a professional and timely manner. They also have an obligation to communicate with victims and be responsive regarding case status and any forensic results which might provide value to the investigation. There are very few “standards” that dictate when evidence must be submitted to a crime laboratory. Florida does not have a statute requiring the submission of SAKs. Unsubmitted SAKs are retained in law enforcement evidence rooms in accordance with the policies of the local law enforcement agency. The decision to submit a kit for testing rests with the local law enforcement agency. Several states including California, Illinois, Michigan, Ohio and Texas have recently passed laws requiring submission of SAKs regardless of the status of the investigation. None of these laws address the submission of kits taken from victims who wish to remain anonymous (non-reporting victims).

In August 2015, in cooperation with the Florida Sheriffs Association and the Florida Police Chiefs Association, FDLE developed and launched a survey of Florida’s sheriff and police agencies to determine the number of unsubmitted SAKs and the reasons the kits had not been submitted to a forensic laboratory for testing (survey questions are included in the Appendix). The online survey instrument allowed law enforcement agencies in Florida to self-report the number of kits in their inventory and reasons that factor into their agency’s decision not to submit a SAK. The survey was live from August 15 – December 15, 2015 and included responses from 69 percent of Florida’s police departments and 100 percent of the state’s sheriff’s offices. These agencies represent 89 percent of Florida’s population. According to FDLE’s Uniform Crime Report statistics, agencies that responded to the survey reported 91 percent of the total number of rapes reported in 2014.

Survey results indicate there are 13,435 unsubmitted SAKs held in local law enforcement evidence rooms statewide. Summary results by type of agency are presented below. Detailed responses and the list of responding agencies can be found in the Appendix to this report.

Agency Type	Agencies who Responded	Unsubmitted SAK	Should be Submitted SAK
Police Departments	212	6,168	4,147
Sheriffs’ Offices	67	7,267	5,337
Totals	279	13,435	9,484

Of this total, 6,774 kits are housed in jurisdictions served by county forensic laboratories and 6,661 are housed in jurisdictions served by FDLE crime laboratories. As noted later in this report, FDLE has utilized the total unsubmitted kits estimates rather than the “should be submitted” estimates in formulating a business plan for testing SAKs.

¹ The New York County District Attorney’s Sexual Assault Kit Backlog Elimination Program, 2015.

The number of SAKs reported in the “Should be Submitted” column above represents the number of kits that, under agency guidelines, should be submitted to a crime laboratory for testing. As part of the survey, responding agencies were asked to identify from several possible reasons why a SAK in their evidence room may not have been submitted. The survey instrument did not specifically ask agencies to examine all case files associated with SAKs that had not been submitted. The department presumes agencies performed some form of case review or evidence log review to complete their responses. Respondents were allowed to choose more than one answer to this question. A summary of agency responses to this question is provided below:

- 41% - Victim decided not to proceed with the investigation. This category includes victims who after first reporting the crime did not participate in the investigation or prosecution of the case.
- 31% - State Attorney’s Office declined to prosecute.
- 20% - Suspect pled guilty.
- 18% - SAK collected from non-reporting victim. A non-reporting victim is someone who has a kit collected pursuant to an alleged assault but does not wish to file a police report. The kit may be held by local law enforcement or by a rape crisis center for a period of time in the event the victim decides to report. Only if a report is filed, and the victim consents to testing, is the kit forwarded to a laboratory for testing.
- Additional reasons were provided:
 - Allegation was unfounded;
 - Case cleared by exception (victim deceased);
 - Collection preceded analysis technology;
 - Sexual contact is admitted by perpetrator and the case hinges on consent;
 - Suspect convicted on other charges, SAK not needed;
 - Environmental damage to packaging; and
 - Crime laboratory restrictions².

Although not specifically cited as reasons by Florida agencies responding to this survey, other national research such as the 2011 National Center for Victims of Crime publication entitled *Sexual Assault Kit Testing: What Victims Need to Know*, lists the following possible reasons a SAK may not be submitted for analysis:

- Lack of funding for DNA analysis;
- A decision by law enforcement that the results of the kit would not be significant to the investigation;
- Backlogged crime laboratories;
- Law enforcement not prioritizing sexual assault cases; and
- Lack of victim credibility.

² This reason was cited by an agency and refers to an incorrect interpretation of FDLE’s Case Acceptance Policy for Biology/DNA discipline; the department will accept any SAK submitted for testing. This policy is part of the FDLE’s Crime Laboratory Submission Manual.

Biology/DNA Casework

FDLE's crime laboratories are part of the state's crime laboratory system. Section 943.35, Florida Statutes, identifies county forensic laboratories in Broward, Miami-Dade, Palm Beach and Pinellas counties as areas within the state primarily served by a county forensic laboratory. The Indian River Regional County Laboratory is also a part of the state's crime laboratory system and provides primary forensic services to Indian River, Martin, Okeechobee and St. Lucie counties. FDLE has primary responsibility for forensic services to local law enforcement agencies in the 59 remaining Florida counties. FDLE's laboratory system consists of six facilities that offer forensic analysis service in a variety of disciplines including Chemistry, Digital Evidence, Firearms, Trace Evidence, Latent Prints, Toxicology, Questioned Documents, Crime Scene and Biology/DNA. Each discipline is staffed according to workload within the discipline and crime laboratory analysts are not usually qualified to work in multiple sections. There are 95 analysts assigned to the Biology/DNA discipline.

The FDLE laboratory system utilizes several tracking metrics to measure the forensic workload received, including the number of cases, submissions or service requests/tasks received by the laboratory system, a particular forensic section or an individual:

- **Cases:** Represents the number of unique cases received from a criminal justice agency. One case can have multiple submissions of evidence items and it can require testing in one or more of the forensic sections within the laboratory system.
- **Submissions:** A delivery of evidence packages containing one or more items for a particular case. All case evidence can be delivered in one submission or could have multiple submissions as the investigation progresses.
- **Service Requests/Tasks:** Represents the types of forensic services requested or required to complete the analysis for a submission of evidence. There are routinely multiple service requests per case and/or submission. Multiple service requests can exist within a section and can involve multiple sections.

As an example, when a robbery occurs at a drug store, the law enforcement agency submits evidence for latent print analysis, a gun to compare to a cartridge casing at the scene, swabbings from the crime scene for DNA analysis and Latent Print standards from a suspect. The evidence was submitted in three submissions. In this one case, there were three submissions and five service requests across three forensic sections.

The chart below shows the relationship between the three metrics as well as sexual assault case submissions to FDLE laboratories over a four year period. Statistics in this report refer to the number of cases metric because a sexual assault investigation for a single victim will only have one SAK. For this reason, using case numbers to estimate workload and costs is more accurate than other measures.

Sex Assault Cases Received			
	Cases	Submissions	Tasks
2012	1,779	2,239	4,160
2013	1,933	2,454	4,784
2014	2,349	2,926	5,663
2015	4,290+	4,829	7,782

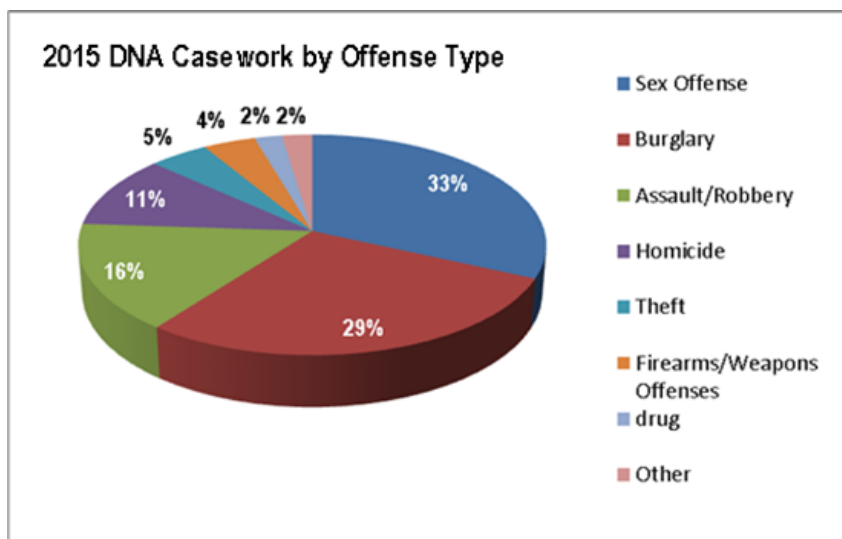

Projected total cases received by FDLE labs based on 2015 monthly average

SAK contents are typically very standardized and, because they are collected directly from the victim's person, generally represent the most probative evidence. Over the past five years, FDLE has received and processed an average of 2,412 SAKs. This volume is expected to grow to an estimated 3,500 kits per year. An analysis of the number of forcible rape offenses reported in Uniform Crime Reports (2011-2014) as well as information provided by the Florida Council Against Sexual Violence, leads FDLE to believe that approximately 71 percent of reported forcible rapes result in the production of a SAK. However, SAKs may not be the only evidence collected during a sexual assault investigation. Other biological evidence might include bedding, clothing, or other articles collected at the crime scene.

Biology/DNA forensic processing requires multi-step analysis. Several laboratory members, numerous consumables and an array of equipment and software are involved before data interpretation begins, quality reviews are completed and a report of the analysis released. The process begins with a screening phase to identify samples most likely to produce probative evidence, inventorying and documenting each sample and placing the samples in tubes which are then sent for DNA testing.

DNA testing involves multiple steps that can vary in time requirements based on the type of case. For example, the processing of samples from a burglary is generally less time consuming than those from sexual assault cases. The nature of sexual assault often leads to mixtures of DNA from more than one individual. Separation of male DNA is often not perfect and the mixed DNA profiles must be examined to see if a foreign donor profile can be resolved. Training, experience and mathematical calculations are used in making these determinations. To ensure quality and accuracy, the results of the analysis of all DNA samples are reviewed by a second qualified analyst. The process of screening through data interpretation can take three to five working days per item submitted. The various levels of technical and peer review can add weeks per case submission. A summary of the steps to process Biology/DNA evidence is included in the Appendix to this report.

In 2015, the department estimates receiving 13,400 incoming Biology/DNA cases statewide. Approximately one-third are related to sexual assault cases. In 2013 and 2014, burglary cases represented the majority of Biology/DNA requests totaling 36 and 35 percent, respectively. For the same period, sexual assaults represented about 22 percent. This reversal in trend reflects the increase in SAKs received during 2015.

A comprehensive business plan that considers current incoming casework as well as the recent bulk submission of older SAKs must include a combination of short and long term

strategies that have proven successful in overcoming backlogs while maintaining current case load. This requires consideration of the following *assumptions*:

- FDLE currently has 95 crime laboratory analysts assigned to Biology/DNA; however, the discipline typically operates at about 80 percent capacity due to vacancies and new analysts in training, giving an effective capacity of 76 crime laboratory analysts.
- The survey identified 6,661 unsubmitted SAKs reported by local law enforcement within FDLE laboratory jurisdictions. Additionally, an estimated 2,000 kits with offenses prior to October 1, 2014 have recently been submitted to an FDLE lab. These approximately 8,600 SAKs are defined as the FDLE SAK backlog.
- This plan does not address the 6,674 unsubmitted SAKs identified through the survey that will be handled by the five non-FDLE laboratories. FDLE suggests funding requests from these entities should be handled as appropriate at the county, state or federal level to handle the backlog in these jurisdictions.
- There are an estimated 3,500 SAKs incoming annually to FDLE.
- Total Biology/DNA incoming cases are estimated at 13,400 in 2015, increasing at an average annual rate of 5 percent.

The use of state and federal funding, as well as asset forfeiture funds such as the DANY grant, to obtain technology to enhance SAK processing and the use of outsourcing will allow the department to effectively and efficiently process the previously unsubmitted SAKs, increase production throughout the Biology/DNA discipline and maintain appropriate staffing to manage the growing demand for services:

1. Funding for Purchasing Technology

- Six additional extraction robots (QIAcubes) designed to separate sperm cell DNA from non-sperm DNA. The QIAcubes increase the speed of the extraction step of the DNA process, producing a cleaner DNA sample, and making data interpretation easier and quicker.
- Three additional instruments (EZ1) used in the purification process to maximize the benefit of the QIAcube and allow for more rapid processing.
- Software programs (probabilistic genotyping) to enhance the speed of difficult mixture interpretation and allow interpretation of multi-donor samples common to SAK cases.

The new QIAcube technology has enabled FDLE to streamline screening processes to allow all male on female SAKs to be screened by differential extraction and quantitation, dropping samples that do not contain male DNA. Between 30-50 percent of SAK cases (1,000 – 1,750 cases) are now complete after the second step in the process, increasing efficiency and saving time. This strategy is credited with enabling FDLE to absorb the increase in sexual assault workload from 2,412 to 3,500 annually.

To maximize the use of the QIAcube, six-person teams will be dedicated to each robot (nine total robots). This strategy requires a commitment of 54 of FDLE's total Biology/DNA FTE (71 percent of the total effective FTE) whose primary assignment will be processing SAKs (35 percent of the workload). The remaining 22 effective FTE will have primary responsibility for the balance (65 percent) of Biology/DNA workload.

At maximum capacity, nine QIAcubes and the dedicated 54-person team could process approximately 6,500 SAKs per year. However, other considerations including total staffing, vacancies, training, court requirements, rush and priority cases will reduce the number of SAKs that can be completed to an estimated 4,500 SAKs per year. This will allow FDLE to keep up with the increased annual volume of 3,500 cases and process 1,000 older SAKs each year.

2. Outsourcing of Selected Cases to Increase Laboratory Production Capacity

Outsourcing case work is a common, industry-accepted tool to help forensic laboratories manage unexpected, unplanned workload. Outsourcing means FDLE’s crime laboratory packages the evidence and sends it to an accredited outsource vendor. Once completed, the vendor returns the analysis to FDLE, where each case undergoes the same rigorous technical and administrative review as a case analyzed in-house. Appropriate results are uploaded to CODIS by FDLE. Outsourcing has the potential to reduce the work hours associated with a case up to 75 percent.

The practice of outsourcing is encouraged by the National Institute of Justice through several grant programs. FDLE has successfully used it to increase productivity for more than a decade. In 2008, the Legislature provided approximately \$2 million in General Revenue funding specifically earmarked for outsourcing Biology/DNA case work. As illustrated in the table below, outsourcing is a major component of the reduction plans in other states with SAK backlog challenges.

Location	# SAK	Start Date	Completion Date	Total Time	Outsourced?	CODIS Hits	Approx. Cost
NYC	17,000	1999	2003	4 years	yes	2000	12 million
Illinois	3,770	2010	2013	4 years	yes	927	3.3 million
Colorado	6,283	2012	2500 complete	4+ years	yes		
Houston	6,663	2013	2015	3 years	yes	850	6 million
Detroit	11,000	2009	2015	6 years	yes	2616	
Ohio	11,400	2011	9000 complete	5+ years	No		
Memphis	12,364	2013	5255 complete	3+ years	yes		6.5 million
Los Angeles	12,500	2009	2011	3 years	yes	753	
*Project ongoing (+)							

FDLE utilizes one vendor, which is accredited by a national forensic accrediting organization. The vendor must additionally meet FDLE standards for testing and reporting and undergo an annual on-site inspection by FDLE. Outsourcing cases is based on several factors including cost predictability, trial status, funding restrictions and overall impact to laboratory efficiency.

Outsource Option A – 8.5 years (\$32 million): FDLE will outsource a maximum 4,300 burglary cases (maximum vendor volume) per year. Burglary cases represent 30 percent of the Biology/DNA incoming workload. With 54 analysts primarily dedicated to processing SAK cases, outsourcing burglary cases will allow the remaining analysts to process the balance of incoming cases, including homicide, robbery, theft, firearms and other violent crime offenses. If only burglary cases are outsourced (no SAKs), the department would work older SAKs at a rate of 1,000 cases per year, taking approximately eight and a half years to complete the processing of the 8,600 backlogged kits.

Outsource Option B – 6.5 years (\$23 million): In addition to outsourcing burglary cases, FDLE will use recently awarded grant funds from the New York District Attorney's Office (DANY) specifically earmarked to outsource 1,776 SAKs from FDLE's Jacksonville Regional Operations Center jurisdiction. These funds, totaling \$1.2 million, are available for immediate use and will be reverted if not used for this purpose. This will reduce the total number of estimated older SAKs from 8,600 to 6,824 and could reduce the estimated time frame for processing these older SAKs to from eight and a half to six and a half years.

Outsource Option C – 3 years (\$8.1million): **Recommended option.** FDLE will outsource a maximum 2,800 older SAKs per year, while continuing to use the QIAcube strategy to keep up with incoming volume. The maximum number of outsourced SAKs is dictated by vendor analysis capacity and the availability of FDLE analysts to package and document the outsourced cases on the front end and quality review the cases on the back end. This includes the 1,776 outsourced SAKs recommended in Option B. FDLE will work burglary cases in house.

Use overtime to encourage trained analysts to increase work hours. These hours are most efficiently used to complete technical and administrative reviews of outsourced cases. Because of the complexity of SAK evidence and the number of samples per case, three burglary cases can be worked in the same amount of time it takes to work one sexual assault case. Outsourcing SAKs will require a smaller volume of cases to be sent to the vendor so there is significantly less administrative time consumed on the front and back end of the outsourcing process. It takes approximately .5 hours to review each outsourced SAK case. It takes approximately .25 hours to review each outsourced burglary case. Outsourcing the sexual assault cases will mean fewer cases to quality review and will eliminate the older SAK backlog more quickly – approximately three years.

Additional Items to Consider

1. Retaining experienced analysts to reduce productivity lost to vacancy and training is critical to long-term success in meeting increasing DNA/Biology service requests. It takes two years to replace the productive capacity of a trained analyst. Including the productivity of trainers, every lost analyst represents an estimated 240 cases. FDLE has requested a competitive pay adjustment as part of its FY 16-17 Legislative Budget Request to slow the exodus for higher paying analyst jobs in city and county crime laboratories.
2. Add FTE to the current number of FDLE trained analysts. Using improved technology and more efficient procedures, as well as overtime and outsourcing, FDLE can process today's incoming volume of Biology/DNA cases. With a five percent annual growth rate projected over the next five years FDLE's Biology/DNA workload will reach 17,103 cases by 2020. The department plans to request a five percent per year increase in Biology FTE to keep pace with the growth, resulting in the addition of 27 FTE over the next five years (five FTE per year 2016 – 2018; six FTE in 2019 and 2020). Three crime laboratory analyst supervisors (CLAS) will also be needed to maintain the department's ratio of one CLAS per eight analyst positions.
3. Increase FDLE laboratory physical capacity. To accommodate the planned growth in FTE, renovations in five of FDLE's six facilities in Ft. Myers, Jacksonville, Orlando,

Tampa and Tallahassee will be needed. If the new Pensacola facility is built, a new laboratory is included in the design so no renovation is projected for that facility.

4. Encourage the timely submission of SAKs and limit the impact to state and county laboratories by developing:
 - Legislation to require law enforcement agencies to implement internal agency policies and/or tracking systems for SAKs;
 - Formal policy requiring the submission of all SAKs except those obtained from a non-reporting victim;
 - Standardized guidelines and procedures for collecting and submitting SAKs in connection with a sexual assault offense; and

Appendix A: FDLE Sexual Assault Kit Survey

The Florida Department of Law Enforcement (FDLE) is conducting a statewide assessment of sex assault kits (SAKs) that have not been submitted for analysis. Through this survey to all local law enforcement agencies, FDLE is attempting to identify the number of untested SAKs stored in law enforcement evidence rooms throughout Florida. The survey will also allow FDLE to prepare for the anticipated workload of processing the SAKs.

For the purpose of this survey, when a SAK is collected but a police report is not filed, the victim is considered a non-reporting victim. The SAK is stored, but the victim does not want law enforcement involvement.

The survey consists of eight (8) questions. For questions or concerns regarding the survey, please contact Marcella Scott MarcellaScott@fdle.state.fl.us.

1. Agency Contact Information

Agency Contact Information	<input type="text"/>
Name of Agency	<input type="text"/>
Your Name	<input type="text"/>
Your Phone Number	<input type="text"/>
Your Email	<input type="text"/>

2. Please enter the county in which your agency is located.

Please enter the county in which your agency is located.

3. Total number of SWORN LAW ENFORCEMENT (do not include corrections) members in your agency

- Less than 100
- 100 - 299
- 300 - 499
- 500 - 699
- 700 - 899
- 900 or more

4. Please indicate how many sexual assault kits have NOT BEEN SUBMITTED for analysis:

5. Of the total number of kits which have not been submitted, please indicate the number of kits that SHOULD BE SUBMITTED for analysis:

6. Please indicate the reasons for not submitting sexual assault kits. (Mark all that apply)

- Please indicate the reasons for not submitting sexual assault kits. (Mark all that apply) Some kits are from non-reporting victims
- Victim no longer wants the investigation to proceed
- Case is not being pursued by the State Attorney's Office
- Suspect has pled guilty/no contest
- Agency does not require submission

Other (please

specify)

7. Approximately how many kits does your agency anticipate submitting for analysis within a 12 month period?

- Approximately how many kits does your agency anticipate submitting for analysis within a 12 month period? Less than 25
- 25-50
- 51-100
- 101-200
- 201-300
- 301-400
- 401-500
- More than 500

 Assessment of Florida's Unsubmitted Sexual Assault Kits
 Responses to Reasons for Not Submitting a Sexual Assault Kit by Agency

Name of Agency	Some kits are from non-reporting victims	Victim no longer wants the investigation to proceed	Case is not being pursued by the State Attorney's Office	Suspect has pled guilty/no contest	Agency does not require submission	Other (please specify)
Alachua County Sheriff's Office						It should be noted that consistency is necessary amongst agencies as it pertains to the statute of limitations for non-reporting victims. We have discovered that there is gross inconsistencies among the agencies in how long agencies hold sexual battery kits. Our investigations have shown that some agencies hold the kits for 90 days and others hold the kits for 4 years and others hold them for periods of time between the two.
Altamonte Springs Police Department		Victim no longer wants the investigation to proceed	Case is not being pursued by the State Attorney's Office	Suspect has pled guilty/no contest		Total Cases Not Filed: 4 - No intent to prosecute, 4 - Unfounded, 3 - Cleared by exception, 2 - Inactive, 1 - No cooperation from victim, 1 - Capias filed, 13 - No filed by SAO, 8 - Plea
Apopka Police Department		Victim no longer wants the investigation to proceed	Case is not being pursued by the State Attorney's Office	Suspect has pled guilty/no contest		
Arcadia Police Department						We have none
Astatula Police Department						
Atlantic Beach Police Department	Some kits are from non-reporting victims	Victim no longer wants the investigation to proceed	Case is not being pursued by the State Attorney's Office	Suspect has pled guilty/no contest

Zephyrhills Police Department					Agency does not require submission	Does not apply

Appendix C: Summary of Biology/DNA Process

Biology/DNA forensic processing requires multi-step analysis. Several laboratory members, numerous consumables and an array of equipment and software are involved before data interpretation begins, quality reviews are completed and a report of the analysis released. The process begins with a screening phase to identify samples most likely to produce probative evidence, inventorying and documenting each sample and placing the samples in tubes which are then sent for DNA testing.

The first step of DNA testing is called extraction, whereby the cellular material is separated from the cotton swab or cutting of evidence and the DNA released from the cells. Extraction involves several stages of washing and purifying the samples and can be done manually, but automated versions of this process require less time and sample manipulation. A differential extraction is required to separate DNA from sperm cells from that of non-sperm cells. It is laborious, yet imperative, to processing sexual assault evidence. Clean DNA samples provide the best possible opportunity to obtain interpretable DNA profiles later in the process.

The next step, quantitation, determines the amount of total human and male-specific DNA present in each sample. If too little male DNA or no human DNA is contained in the sample, testing can be discontinued.

The third step, amplification, creates millions of copies of the specific DNA types (alleles) found in each sample. The copies of fluorescently-labeled DNA fragments undergo separation and detection through a process referred to as capillary electrophoresis conducted on a genetic analyzer instrument. By differentiating between the colored dyes, the genetic analyzer prepares a graph of peaks that represent the DNA types present and their relative amounts.

During data analysis and interpretation, the peaks are assigned numbers and transferred to a table for comparisons. The nature of sexual assault often leads to mixtures of DNA from more than one individual. Separation of male DNA is often not perfect and the mixed DNA profiles must be examined to see if a foreign donor profile can be resolved. Training, experience and mathematical calculations are used in making these determinations. To ensure quality and accuracy, the results of the analysis of all DNA samples are reviewed by a second qualified analyst.

DNA profiles developed as a result of the analysis will be entered into appropriate CODIS in accordance with database criteria. CODIS is a three-tiered system consisting of local (LDIS), state (SDIS) and national (NDIS) databases. Criteria for entering and searching data become increasingly restrictive as the levels progress. Some profiles can be entered at the local and state levels but are not eligible for upload to NDIS. For example, a profile developed from a non-reporting victim's SAK can be entered into Florida's DNA Database, but is not eligible, under FBI guidelines, to be entered into the national database.

Finally, all of the results, interpretations and conclusions from the case documentation are transferred to a final report. The file, which contains any CODIS entries, and report are then submitted for technical review by an additional qualified analyst, followed by an administrative review. Once both reviews are complete, the report is released and evidence returned to the contributing agency. The process from screening through data interpretation can take three to five working days per item submitted. The various levels of review can add two to four weeks per case submission.

Appendix D

Sexual Assault Kit Reduction Plan Option A

8.5 years - \$32,057,598

Assumes no outsourcing of sexual assault kits. Includes 6661 reported from survey, 2000 received in lab Jan-Oct 2015 = 8600 (rounded) backlog

Assumes outsourcing 4300 burglary cases annually

Assumes processing 1000 older SAKs in house annually for 8.5 years

Assumes processing 3500 new volume SAKs in house annually [including typical incoming + 1,000 projected annual increase]

*Assumes effective productive capacity at 76 FTE (80%*95 CLA)*

	Funded	2016	2017	2018	2019	2020	2021	2022	2023	2024 (6 mos)
